

Task Mangement

(Project ETA: 3 days)

Technical Detail

This assignment is consisted of 4 projects as listed below:

- TaskManagementApi (Visual Studio)
- TaskMangementWeb (Visual Studio)
- TaskMangementApi.Tests (Visual Studio)
- AngularApp (Visual Source Code)

It's code is available as a public repo on Github as follow:

<https://github.com/wqrana/TaskManagementApp.git>

TaskMangementApi:

This project is developed as a beck-end by using Web Api in .Net 8, Entity framework core with SQL Server as localdb. Connection detail is provided in appsettings.json file of the project. Morover, there is also another connection setting to configure the SQL Server instance with credentials. However, for database creation, either run the migration commands from the Nuget Manager Console or run the migration script provided in .sql file after creating the database 'TaskDB' in localdb.

Option 1:

Run migrations commands for api project in Nuget Console

PM> add-migration initDB

PM> update-database

Option 2:

Create database 'TaskDB' in MS SQL LocalDB and run the migration script file

FullExecutedMigrations.sql

TaskMangementApi.Tests:

This project is developed by using NUnit Testing framework to unit test the Web Api different operations.

TaskMangementWeb:

This project is developed as MVC by using .Net 8 to host the front-end as developed in angular 20. There is folder (wwwroot\angular-app), when angular project is build, it places the generated files here.

AngularApp:

This project is developed by using Angular 20 to implement the front-end. Its configure to generate the build files on specific folder inside TaskMangementWeb project.
